

May 22 to June 18, 2016 (Weeks 21-24)

Overall Summary

- Overall, influenza activity continues to decrease across Canada and has reached interseasonal levels.
- Sporadic activity is being reported in several parts of Canada; however, the majority of regions are reporting no influenza activity.
- No influenza outbreaks have been reported since week 22 (beginning of June).
- Influenza-associated hospitalizations continue to decrease. Ten hospitalizations were reported in week 24
- For more information on the flu, see our [Flu\(influenza\)](#) web page.

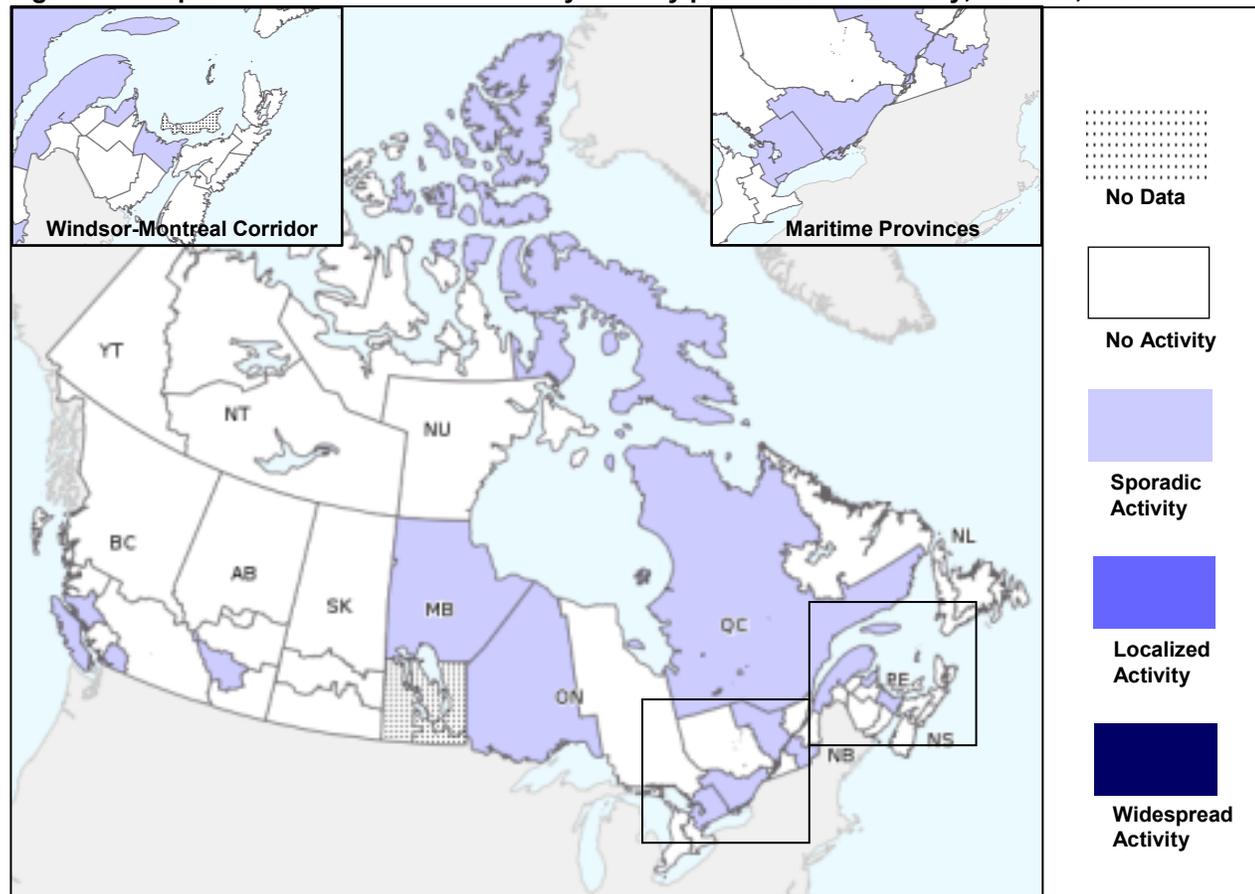

Many thanks to all the sentinels participating in our influenza-like illness surveillance network. Your hard work is greatly appreciated!

If you are a primary health care practitioner (General Practitioner, Nurse Practitioner or Registered Nurse) interested in becoming a FluWatch sentinel for the 2016-17 influenza season, please contact us at FluWatch@phac-aspc.gc.ca

Influenza/Influenza-like Illness (ILI) Activity (geographic spread)

In week 24, influenza activity continues to be reported in parts of Canada. Sporadic activity was reported in 14 regions across six provinces (BC, AB, MB, ON, QC, NB and NU). A total of 34 regions reported no influenza activity.

Figure 1 – Map of overall influenza/ILI activity level by province and territory, Canada, Week 24

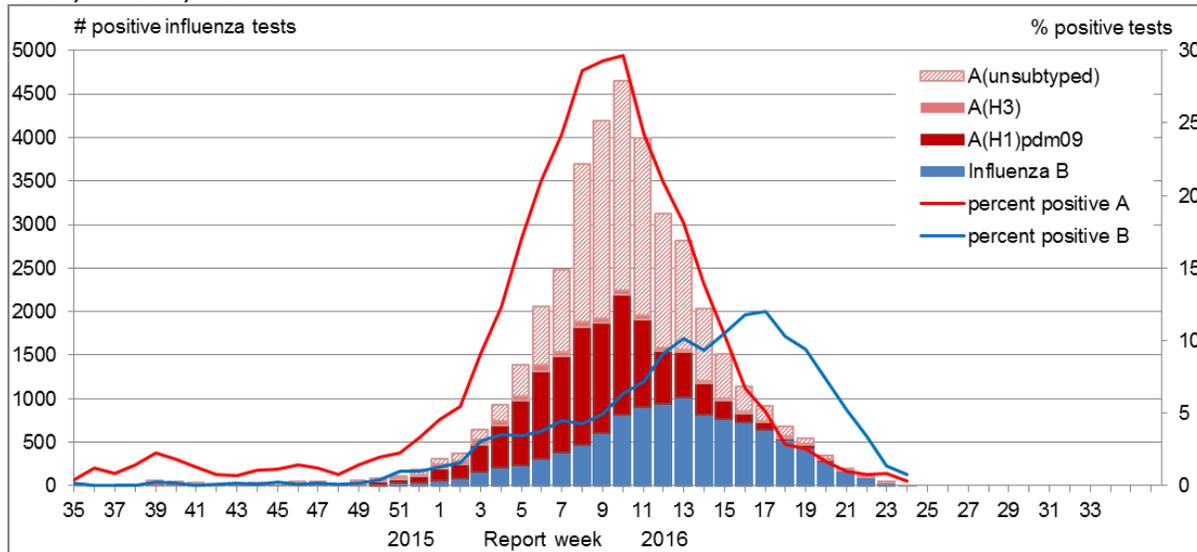

Note: Influenza/ILI activity levels, as represented on this map, are assigned and reported by Provincial and Territorial Ministries of Health, based on laboratory confirmations, sentinel ILI rates and reported outbreaks. Please refer to detailed definitions at the end of the report. Maps from previous weeks, including any retrospective updates, are available in the mapping feature found in the [Weekly Influenza Reports](#).

Laboratory Confirmed Influenza Detections

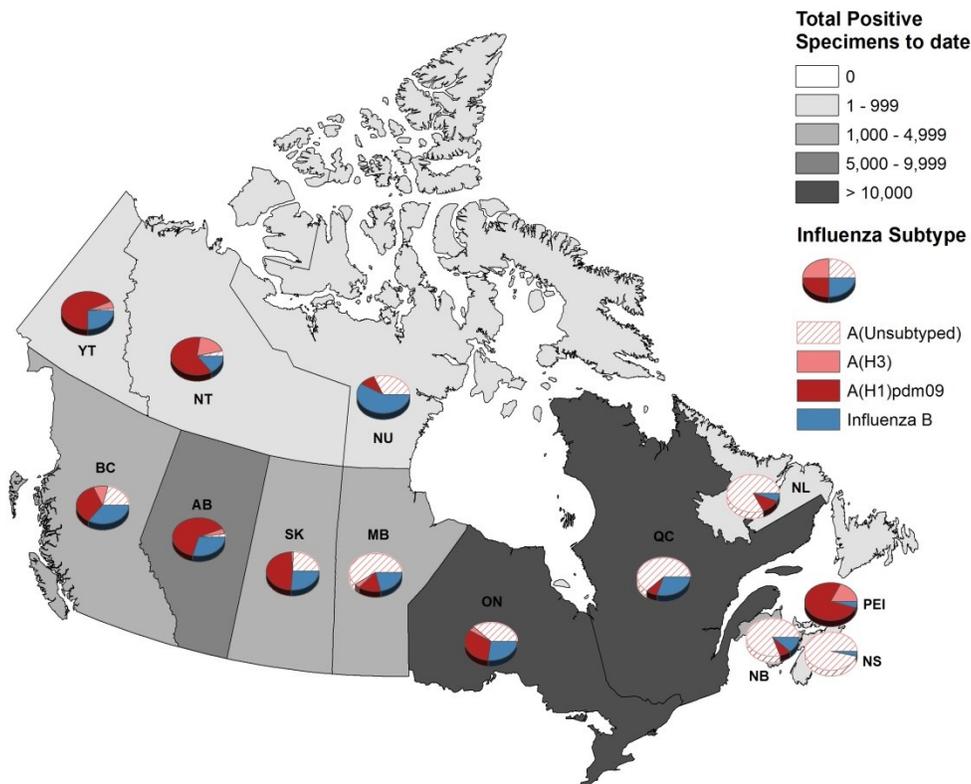

In weeks 21-24, the percentage of tests positive for influenza continued to decrease [from 6.2% in week 21 to 1.1% in week 24]. Compared to the previous five seasons, the percent positive (1.1%) reported in week 24 was within expected levels (confidence interval 1.0-2.6%) and has returned to interseasonal levels.

Figure 2 – Number of positive influenza tests and percentage of tests positive, by type, subtype and report week, Canada, 2015-16

Nationally in weeks 21-24, there were 389 positive influenza tests reported. Influenza B continues to account for the majority of influenza detections, representing 79% of detections in weeks 21-24. Overall in week 24, laboratory detections of influenza were low across Canada with total of 24 influenza detections reported. To date, 72% of influenza detections have been influenza A and among those subtyped, the vast majority have been influenza A(H1N1) [91% (11019/12147)].

Figure 3 – Cumulative numbers of positive influenza specimens by type/subtype and province, Canada, 2015-16

Note: Specimens from NT, YT, and NU are sent to reference laboratories in other provinces. Cumulative data include updates to previous weeks.

To date this season, detailed information on age and type/subtype has been received for 33,414 cases. Children and teenagers (0-19yrs) accounted for 48% of influenza B cases and approximately one third of all influenza cases. Children and teenagers (0-19yrs), young adults (20-44yrs) and middle-aged adults (45-64yrs) accounted for approximately an equal proportion of influenza A(H1N1) cases.

Table 1 – Weekly and cumulative numbers of positive influenza specimens by type, subtype and age-group reported through case-based laboratory reporting¹, Canada, 2015-16

Age groups (years)	Weeks (May 22, 2016 to Jun. 18, 2016)					Cumulative (Aug. 30, 2015 to Jun. 18, 2016)						
	Influenza A				B	Influenza A				B	Influenza A and B	
	A Total	A(H1) pdm09	A(H3)	A (UnS) ³	Total	A Total	A(H1) pdm09	A(H3)	A (UnS) ³	Total	#	%
<5	9	<5	<5	7	60	4533	1714	76	2743	1768	6305	19%
5-19	9	<5	<5	<5	25	2408	1026	101	1281	2695	5105	15%
20-44	14	<5	<5	8	14	5816	2758	166	2892	2197	8017	24%
45-64	<5	0	0	<5	46	6396	2797	201	3398	1103	7505	22%
65+	15	<5	6	x	42	4863	1624	446	2793	1610	6482	19%
Total	48	11	12	25	187	24016	9919	990	13107	9373	33414	100%
Percentage²	20%	23%	25%	52%	80%	72%	41%	4%	55%	28%		

¹Table 1 includes specimens for which demographic information was reported. These represent a subset of all positive influenza cases reported.

²Percentage of tests positive for sub-types of influenza A are a percentage of all influenza A detections.

³UnS: unsubtyped: The specimen was typed as influenza A, but no result for subtyping was available.

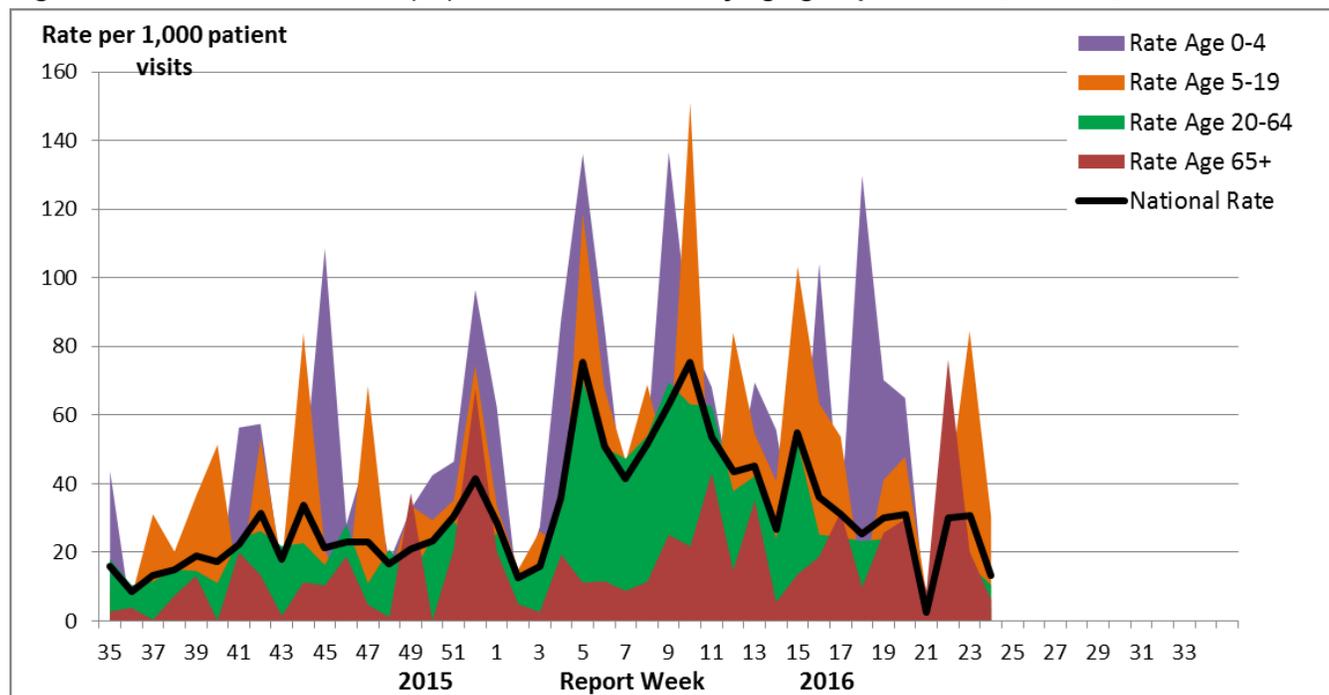

x - Suppressed to prevent residual disclosure.

For data on other respiratory virus detections see the [Respiratory Virus Detections in Canada Report](#) on the Public Health Agency of Canada website.

Influenza-like Illness Consultation Rate

The national ILI consultation rate decreased from previous weeks from 30.1 per 1,000 patient visits in week 22, to 13.4 per 1,000 patient visits in week 24. The ILI rate for week 21 was lower than expected due to a low response rate resulting from a technical error in data collection. In week 24, the highest ILI consultation rate was found in the 5-19 years age group (30.3 per 1,000) and the lowest was found in the 0-4 years age group (3.6 per 1,000) (Figure 4).

Figure 4 – Influenza-like illness (ILI) consultation rates by age group and week, Canada, 2015-16

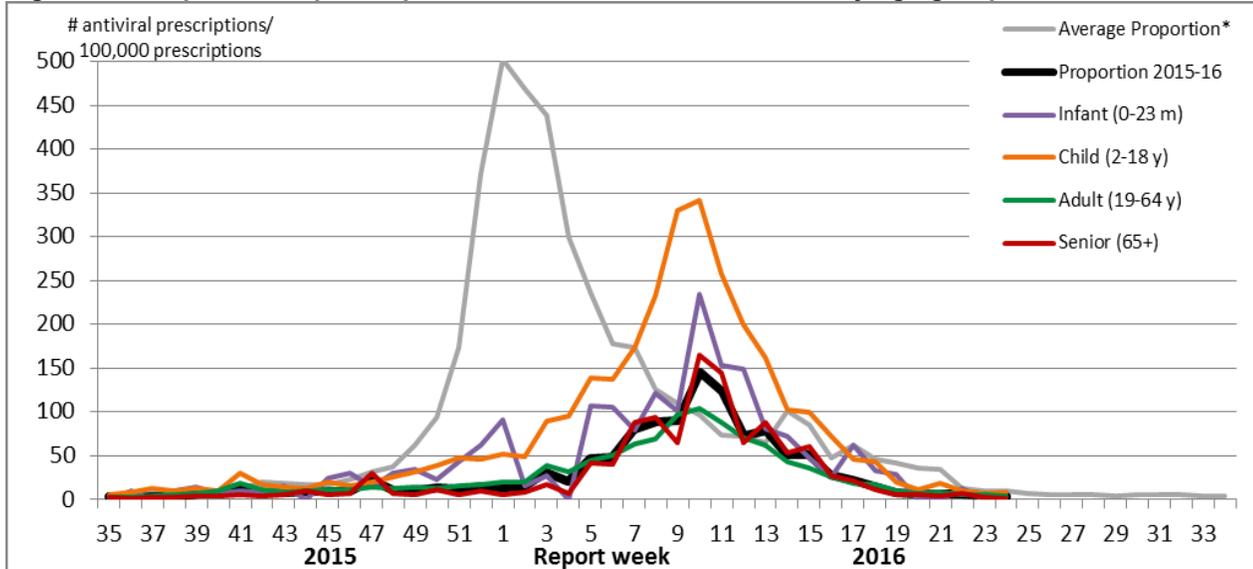

Delays in the reporting of data may cause data to change retrospectively. In BC, AB, and SK, data are compiled by a provincial sentinel surveillance program for reporting to FluWatch. Not all sentinel physicians report every week.

Pharmacy Surveillance

In the period of weeks 21-24, the proportion of prescriptions for antivirals continued to decrease steadily to 2.9 antiviral prescriptions per 100,000 total prescriptions in week 24. This rate is lower than the five year historical average for week 24. The proportion of prescriptions for antivirals remains highest among children. In week 24, the proportion reported among children was 8.1 per 100,000 total prescriptions.

Figure 5 – Proportion of prescription sales for influenza antivirals by age group and week, Canada, 2015-16

Note: Pharmacy sales data are provided to the Public Health Agency of Canada by Rx Canada Inc. and sourced from major retail drug chains representing over 3,000 stores nationwide (excluding Nunavut) in 85% of Health Regions. Data provided include the number of new antiviral prescriptions (for Tamiflu [oseltamivir] and Relenza [zanamivir]) and the total number of new prescriptions dispensed by Province/Territory and age group.

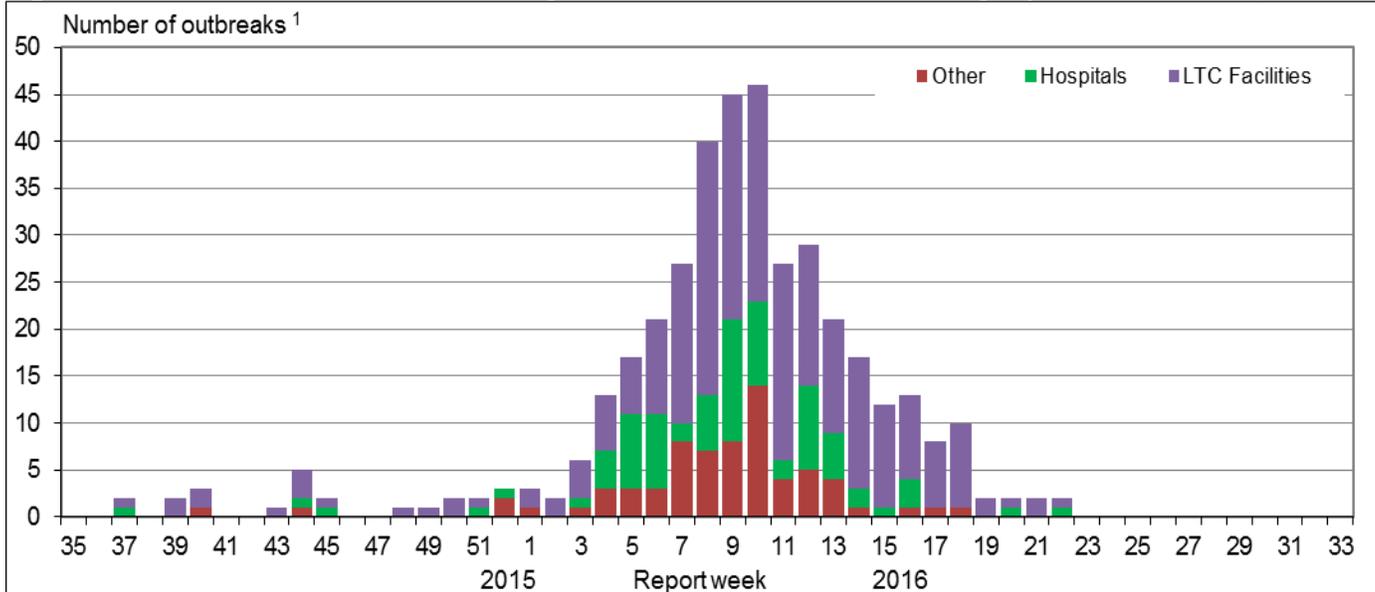

*The average weekly proportion includes data from April 2011 to March 2015.

Influenza Outbreak Surveillance

In weeks 21-24, four new laboratory confirmed influenza outbreaks were reported: two in long-term care facilities (LTCF) and two in hospitals. All outbreaks were reported in weeks 21 and 22. Three outbreaks were due to influenza B and one was due to influenza A(unsupported).

To date this season, 427 outbreaks have been reported. At week 24 in the 2014-15 season, 1,732 outbreaks were reported and in the 2013-14 season, 268 outbreaks were reported.

Figure 6 – Overall number of new laboratory-confirmed influenza outbreaks by report week, Canada, 2015-2016

¹All provinces and territories except NU report influenza outbreaks in long-term care facilities. All provinces and territories with the exception of NU and QC report outbreaks in hospitals. Outbreaks of influenza or influenza-like-illness in other facilities are reported to FluWatch but reporting varies between jurisdictions. Outbreak definitions are included at the end of this report.

Sentinel Hospital Influenza Surveillance

Pediatric Influenza Hospitalizations and Deaths

In weeks 21-24, 16 laboratory-confirmed influenza-associated pediatric (≤ 16 years of age) hospitalizations were reported by the Immunization Monitoring Program Active (IMPACT) network (Figure 7). The majority of hospitalizations (81%) were due to influenza B.

A total of 222 intensive care unit (ICU) admissions have been reported. Children aged 2 to 4 and 5 to 9 years accounted for 27% and 26% of ICU admissions respectively. A total of 158 ICU cases (71%) reported at least one underlying condition or comorbidity. Eight influenza-associated deaths have been reported.

To date this season, 1,364 hospitalizations have been reported by the IMPACT network: 900 cases (66%) were due to influenza A and 464 cases (34%) were due to influenza B. This season's count of pediatric hospitalizations is nearly double that reported up to week 24 in the 2014-15 season (N=711). The current year total number of cases also exceeds the total number of cases reported in the past five seasons.

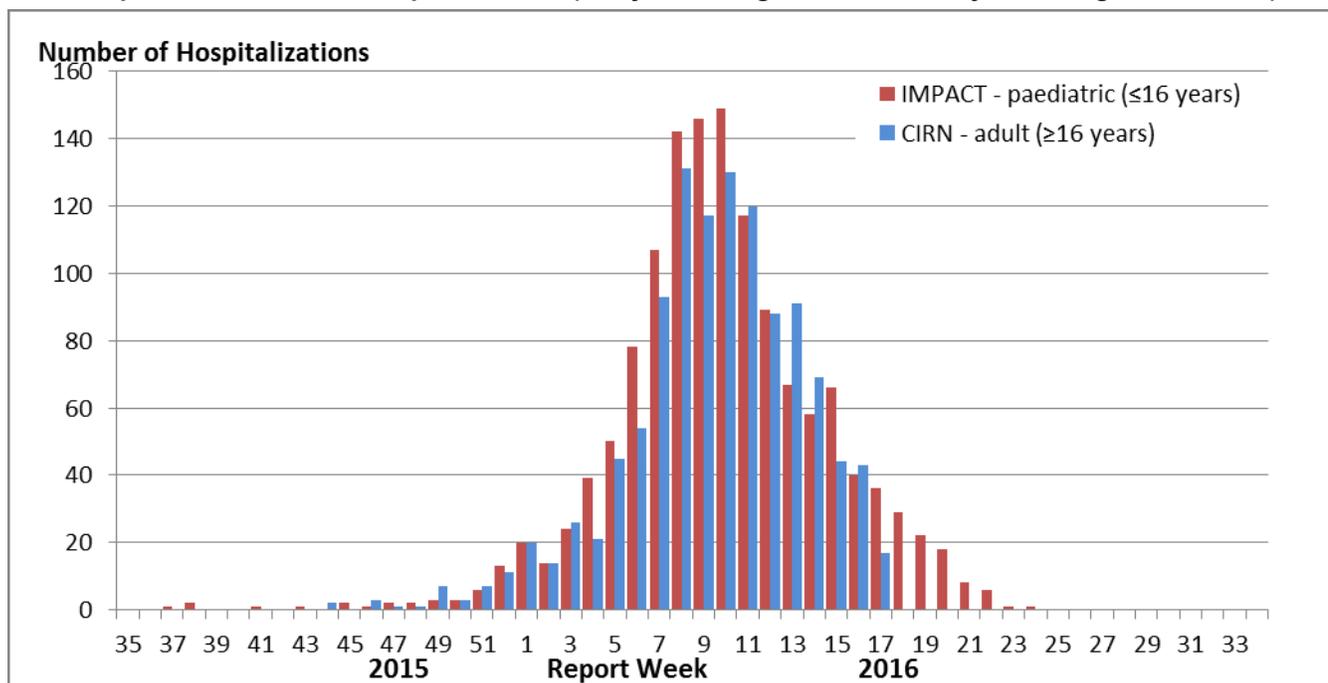

Table 2 – Cumulative numbers of pediatric hospitalizations (≤ 16 years of age) with influenza reported by the IMPACT network, Canada, 2015-16*

Age Groups	Cumulative (30 Aug. 2015 to 18 Jun. 2016)					
	Influenza A				Influenza B	Influenza A and B (#(%))
	A Total	A(H1) pdm09	A(H3)	A (UnS)	B Total	
0-5m	122	33	<5	x	40	162 (12%)
6-23m	281	80	7	194	99	380 (28%)
2-4y	255	80	5	170	119	374 (27%)
5-9y	183	49	<5	x	146	329 (24%)

Total	900	260	21	619	464	1364 (100%)

x - Suppressed to prevent residual disclosure

*Not included in Table 2 are two IMPACT cases that were due to co-infections of influenza A and B.

Figure 7 – Number of hospitalized cases of influenza reported by sentinel hospital networks, by week, Canada, 2015-16, pediatric and adult hospitalizations (≤ 16 years of age, IMPACT; ≥ 16 years of age, CIRN-SOS)*

*Not included in Figure 7 are two IMPACT cases that were due to co-infections of influenza A and B.

Adult Influenza Hospitalizations and Deaths

Surveillance for the 2015-2016 influenza season ended on April 30th, 2016 (week 20).

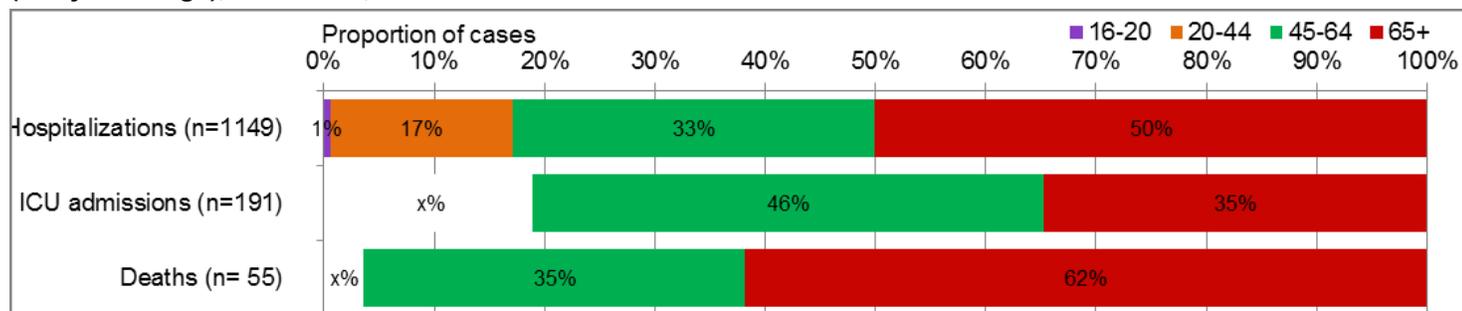

For the 2015-16 season, 1,153 hospitalizations have been reported by CIRN-SOS (Table 3). The majority of hospitalized cases were due to influenza A (81%) and the largest reported proportion was among adults ≥65 years of age (50%). One hundred and ninety-one intensive care unit (ICU) admissions have been reported of which 132 cases reported at least one underlying condition or comorbidity. A total of 55 deaths have been reported this season with the majority of deaths reported in adults ≥65 years of age (62%).

Table 3 – Cumulative numbers of adult hospitalizations (≥16 years of age) with influenza reported by CIRN-SOS, Canada, 2015-16

Age groups (years)	Cumulative (Nov. 1, 2015 to Apr. 30, 2016)					
	Influenza A				B	Influenza A and B
	A Total	A(H1) pdm09	A(H3)	A(UnS)	Total	# (%)
16-20	x	<5	0	<5	<5	x
20-44	144	50	<5	x	46	190 (16%)
45-64	331	105	<5	x	46	377 (33%)
65+	452	125	24	303	123	575 (50%)
Unknown	<5	x	0	<5	<5	<5
Total	934	285	28	621	219	1153
%	81%	31%	3%	66%	19%	100%

x - Suppressed to prevent residual disclosure

Figure 8 – Percentage of hospitalizations, ICU admissions and deaths with influenza reported by age group (≥16 year of age), CIRN-SOS, Canada 2015-16*

Note: The number of hospitalizations reported through CIRN-SOS and IMPACT represents a subset of all influenza-associated adult and pediatric hospitalizations in Canada. Delays in the reporting of data may cause data to change retrospectively.

*Age was unknown for <5 cases.

x - Suppressed to prevent residual disclosure

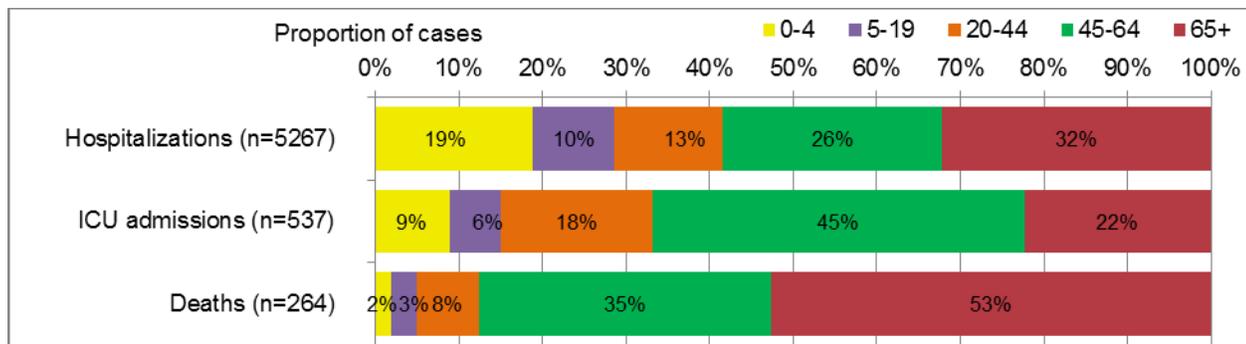

Provincial/Territorial Influenza Hospitalizations and Deaths

In week 24, 10 hospitalizations were reported by participating provinces and territories*. In total, 98 hospitalizations were reported in weeks 21-24, with the number of cases decreasing each week. Three ICU admissions were reported during the week 21-24 period.

Since the start of the 2015-16 season, 5,267 laboratory-confirmed influenza-associated hospitalizations have been reported. A total of 4,094 hospitalizations (78%) were due to influenza A and 1,173 (22%) were due to influenza B. Of the 537 ICU admissions reported, 474 (88%) were due to influenza A. A total of 264 deaths have been reported; all but 41 were associated with influenza A.

Overall this season, hospitalizations have been reported more frequently among adults ≥ 65 years of age. The largest proportion of ICU admissions was reported in adults 45-64 years of age and the highest proportion of fatal cases was reported in adults ≥ 65 years of age (Figure 9). Pediatric (0-19 years) accounted for 29% of all hospitalizations and 5% of all deaths reported to date this season. Similar to findings from the IMPACT network, there have been more pediatric hospitalizations reported to date compared to the year-end totals in each of the previous [four influenza seasons](#).

Figure 9 – Percentage of hospitalizations, ICU admissions and deaths with influenza reported by age group, Canada 2015-16

* Note: Influenza-associated hospitalizations are not reported to PHAC by the following Provinces and Territory: BC, NU, and QC. Only hospitalizations that require intensive medical care are reported by SK. ICU admissions are not distinguished among hospital admissions reported from ON. Data may also include cases reported by the IMPACT and CIRN-SOS networks. The number of new influenza-associated hospitalizations and deaths reported for the current week may include cases from ON that occurred in previous weeks, as a result of retrospective updates to the cumulative total. It is important to note that the hospitalization or death does not have to be attributable to influenza, a positive laboratory test is sufficient for reporting.

See additional data on [Reported Influenza Hospitalizations and Deaths in Canada: 2011-12 to 2015-16](#) on the Public Health Agency of Canada website.

Influenza Strain Characterizations

During the 2015-16 influenza season, the National Microbiology Laboratory (NML) has characterized 2,871 influenza viruses [236 A(H3N2), 1,450 A(H1N1) and 1,185 influenza B].

Influenza A (H3N2): When tested by hemagglutination inhibition (HI) assays, 75 A(H3N2) viruses were antigenically characterized as A/Switzerland/9715293/2013-like using antiserum raised against cell-propagated A/Switzerland/9715293/2013.

Sequence analysis was done on 161 A(H3N2) viruses. All viruses belonged to a genetic group for which most viruses were antigenically related to A/Switzerland/9715293/2013. A/Switzerland/9715293/2013 is the A(H3N2) component of the 2015-16 Northern Hemisphere's vaccine.

Influenza A (H1N1): All of the 1,450 A(H1N1) viruses characterized were antigenically similar to A/California/7/2009, the A(H1N1) component of the 2015-16 influenza vaccine.

Influenza B: A total of 248 influenza B viruses characterized were antigenically similar to the vaccine strain B/Phuket/3073/2013. A total of 937 influenza B viruses were characterized as B/Brisbane/60/2008-like, one of the influenza B components of the 2015-16 Northern Hemisphere quadrivalent influenza vaccine.

The NML receives a proportion of the influenza positive specimens from provincial laboratories for strain characterization and antiviral resistance testing. Characterization data reflect the results HI testing compared to the reference influenza strains recommended by [WHO](#).

Antiviral Resistance

During the 2015-16 season, the National Microbiology Laboratory (NML) has tested 1,966 influenza viruses for resistance to oseltamivir and zanamivir and 1,691 influenza viruses for resistance to amantadine. All but 10 tested viruses were sensitive to oseltamivir. The 10 H1N1 viruses resistant to oseltamivir had a H275Y mutation. All viruses tested for resistance were sensitive to zanamivir. All but two influenza A viruses were resistant to amantadine (Table 4).

Table 4 – Antiviral resistance by influenza virus type and subtype, Canada, 2015-16

Virus type and subtype	Oseltamivir		Zanamivir		Amantadine	
	# tested	# resistant (%)	# tested	# resistant (%)	# tested	# resistant (%)
A (H3N2)	185	0 (0%)	185	0 (0%)	237	236 (99.6%)
A (H1N1)	1092	10 (0.9%)	1092	0 (0%)	1454	1453 (99.9%)
B	689	0 (0%)	689	0 (0%)	NA ¹	NA ¹
TOTAL	1966	10 (0.5%)	1966	0 (0%)	1691	1689 (99.9%)

¹NA: Not Applicable

FluWatch Definitions for the 2015-2016 Season

Abbreviations: Newfoundland/Labrador (NL), Prince Edward Island (PE), New Brunswick (NB), Nova Scotia (NS), Quebec (QC), Ontario (ON), Manitoba (MB), Saskatchewan (SK), Alberta (AB), British Columbia (BC), Yukon (YT), Northwest Territories (NT), Nunavut (NU).

Influenza-like-illness (ILI): Acute onset of respiratory illness with fever and cough and with one or more of the following - sore throat, arthralgia, myalgia, or prostration which is likely due to influenza. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

ILI/Influenza outbreaks

Schools: Greater than 10% absenteeism (or absenteeism that is higher (e.g. >5-10%) than expected level as determined by school or public health authority) which is likely due to ILI. Note: it is recommended that ILI school outbreaks be laboratory confirmed at the beginning of influenza season as it may be the first indication of community transmission in an area.

Hospitals and residential institutions: two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case. Residential institutions include but not limited to long-term care facilities (LTCF) and prisons.

Workplace: Greater than 10% absenteeism on any day which is most likely due to ILI.

Other settings: two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case; i.e. closed communities.

Note that reporting of outbreaks of influenza/ILI from different types of facilities differs between jurisdictions.

Influenza/ILI Activity Levels

1 = No activity: no laboratory-confirmed influenza detections in the reporting week, however, sporadically occurring ILI may be reported

2 = Sporadic: sporadically occurring ILI and lab confirmed influenza detection(s) with **no outbreaks** detected within the influenza surveillance region†

3 = Localized: (1) evidence of increased ILI* ;
(2) lab confirmed influenza detection(s);
(3) **outbreaks** in schools, hospitals, residential institutions and/or other types of facilities occurring in **less than 50% of the influenza surveillance region†**

4 = Widespread: (1) evidence of increased ILI*;
(2) lab confirmed influenza detection(s);
(3) **outbreaks** in schools, hospitals, residential institutions and/or other types of facilities occurring **in greater than or equal to 50% of the influenza surveillance region†**

Note: ILI data may be reported through sentinel physicians, emergency room visits or health line telephone calls.

** More than just sporadic as determined by the provincial/territorial epidemiologist.*

† Influenza surveillance regions within the province or territory as defined by the provincial/territorial epidemiologist.

We would like to thank all the Fluwatch surveillance partners who are participating in this year's influenza surveillance program.
